

The Benefits of Recycled Water

Recycled water supplements local water supplies and reduces dependency on imported water.

Recycled water replenishes groundwater basins and serves as a barrier to seawater intrusion

Recycled water is used throughout California to irrigate crops, parks, golf courses, and freeway landscapes. Indirect potable reuse projects include:

- Rose Hills
- South El Monte
- Whittier Narrows
- City of Industry

Recycled water has been a key part of Upper District's overall strategy of supplementing local water supplies and replenishing the groundwater basin.
